Lesson Review

Lesson 4

Vocabulary

Draw a line to connect the following terms to their definitions.

1 fossil 2 geologic time scale 3 fossil record 4 extinction	A all of the fossils that have been discovered worldwide B death of every member of a species C trace or remains of an organism that lived long ago D division of Earth's history into manageable parts
---	---

Critical Thinking

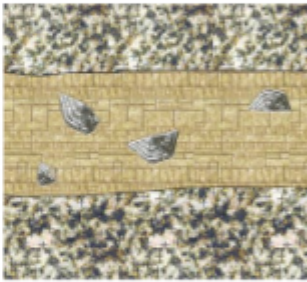

7 Contrast How do the atmospheric conditions near the beginning of Precambrian time contrast with the atmospheric conditions that are present now? Which organism is largely responsible for this change?

Key Concepts

5 List What four major divisions make up the history of life on Earth in the geologic time scale?

6 Explain What is one distinguishing feature of each of the four major divisions listed in your previous answer?

Use this drawing to answer the following question.

8 Explain The fossils shown are of a marine organism. In which of the three rock layers would you expect to find fossils of an organism that went extinct before the marine organism evolved? Explain your answer.

1-4 C,D,A,B

5. Precambrian time, the Paleozoic era, the Mesozoic era, and the Cenozoic era.

6. Single-celled prokaryotes dominated Earth during Precambrian time. Plants, fungi, and air-breathing animals colonized land during the Paleozoic era. Dinosaurs dominated Earth during the Mesozoic era. Mammals have dominated Earth during the Cenozoic era.

7. The atmosphere has a much greater percentage of oxygen now than it did before.

Cyanobacteria.

8. Fossils of an organism that went extinct before this organism evolved would be found only in the very bottom rock layer, beneath the fossil shown, because that rock layer is older and formed first.
